California Department of Public Health Confirms Measles Cases

Sacramento – California Department of Public Health has been notified of seven confirmed cases of measles in patients from five different locations within California it was reported today by Dr. Ron Chapman, CDPH director and state health officer. Two Utah resident cases have also been confirmed and three additional California residents are also suspected to have measles and are under investigation. All confirmed and suspect cases reported visiting Disneyland or Disney California Adventure Park in Orange County, California sometime between December 15th and December 20th, 2014.

Based on information from current cases, it is likely that a person infectious with measles was at one of the theme parks on these dates. People can be infectious with measles for 9 days. Measles typically begins with fever, cough, runny nose and red eyes and within a few days a red rash appears, usually first on the face and then spreads downward to the rest of the body. Measles is a highly infectious, airborne disease.

“If you have symptoms, and believe you may have been exposed, please contact your health care provider,” said Dr. Chapman. “The best way to prevent measles and its spread is to get vaccinated.”

Measles has been eliminated in the United States since 2000. However, large measles outbreaks have occurred in Western Europe, Pakistan, Vietnam and the Philippines in recent years. Travelers to areas where measles is endemic can bring measles back to the U.S., resulting in limited domestic transmission of measles. Disney and other theme parks in California are international attractions and visitors come from many parts of the world, including those where measles is endemic.

Two doses of measles-containing vaccine (MMR vaccine) are more than 99 percent effective in preventing measles. Measles vaccines have been available in the United States since 1963, and two doses have been recommended since 1989. If you are unsure of your vaccination status, check with your doctor to have a test to check for measles immunity or to receive vaccination.

The California confirmed cases reside in five local health jurisdictions (Alameda, Orange, Pasadena, Riverside, and San Diego) and range in age from 8 months to 21 years. Six cases were unvaccinated for measles (2 were too young to be vaccinated), and 1 had received appropriate vaccination (two doses of MMR vaccine). Several large contact investigations are ongoing.

Health care providers treating patients with fever and a rash should consider measles, and ask patients about travel to international destinations and domestic venues that are popular with international travelers.

More information about measles can be found on the [CDPH website](#).
